The present sequence represents a partial human interleukin-22 (IL-22) protein. The specification also describes IL-21 polynucleotides and polypeptides. The IL-21 polynucleotide was isolated from a cDNA library of epileptic frontal cortex. IL-21 and IL-22 may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization chambidate by activating or chemotaxis) of immune cells, treating or detecting deficiencies or disorders of haematopoletic cells, to modulate haemostatic or thrombolytic activity, in treating or detecting autoimmune disorders, thrombolytic activity, in treating or detecting autoimmune disorders, creating asthma (particularly allergic asthma) or other respiratory problems, to treat and/or prevent organ rejection or graft-versus-host disease (GVHD), to modulate inflammation, to treat or detect hyperproliferative disorders, to treat or detect infectious agents, to differentiation of tissues, IL-21 and IL-22 may also increase or decrease the differentiation or proliferation of embryonic stem cells and harmatopoletic lineage, may be used to modulate mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; interleukin-22; IL-22; IL-21; immune system disorder; inmune cell chemotaxis; haematopoietic cell disorder; haemostatic activity; thrombolytic activity, autoimmune disorder; asthma; respiratory problem; organ rejection; graft-versus-host disease; GVHD; inflammation; hyperproliferative disorder; tissue regeneration; embryonic stem cell differentiation; embryonic stem cell differentiation; embryonic stem cell differentiation; haematopoietic lineage; allergic asthma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a partial human interleukin-22 (IL-22) protection. The specification also describes IL-21 polynucleotides and polypeptides. The IL-21 polynucleotide was isolated from a cDNA library of epileptic frontal cortex. IL-21 and IL-22 may be useful in treating of epileptic frontal cortex. IL-21 and IL-22 may be useful in treating confidencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune calls, treating or detecting deficiencies of haematopoietic cells, to modulate haemostatic or thrombolytic activity, in treating or detecting autoimmune disorders, treating activity, in treating or detecting autoimmune disorders, treating activity altered or or or or or or or detect hyperproliferative disorders, to treat or detect inflammation, to treat or detect hyperproliferative disorders, to treat or detect inflammation, to treat or detect inflammation, to treat or detect inflammation or decrease the differentiate, proliferate and attract cells, leading to the regeneration of tissues, IL-21 may also increase or decrease the differentiation or proliferation of embryonic stem cells and haematopoietic lineage, may be used to modulate mammalian characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ó;

                                                                                                                                                                                                                                                  The present sequence is the mature human transforming growth factor beta-9, designated 2tgf beta-9. This is a mature sequence excluding the signal sequence extending from amino acid 18 to and including amino acid 202 of 2tgf beta-9. Human 2tgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS). Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                68 PEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLRRTPACAGGRSVYTEAYVTIPVGCTC 127

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    beta-9, designated zigi beta-9. This is a mature sequence excluding the signal sequence extending from anno acid 17 to and including amino acid 202 of zigi beta-9. Human zigi beta-9 was isolated from an arrayed pitultary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzehimar's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating altisates including multiple sclerosis. Zigi beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes,

This is a mature sequence excluding the signal sequence extending from amino acid 16 to and including amino acid 202 of Ztyf beta-9. Human Ztyf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's diseases, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztyf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.

                                                                                                                                                                                                            N-PSDB; AAZ52195
```

```
The present sequence represents an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-176, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLRRTPACAGGRSVYTEAYVTIPVGCTC 127

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a mature variant human transforming growth factor beta-9 protein, designated Ztgf beta-9. Human Ztgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.

                                                                         Protein
```

```
ö
           The present sequence represents an interleukin (IL)-173 polypeptide. It is a mammalian homologue of the cytckine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-17, IL-172, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and cDNA molecules which code for related or homologues proteins. The IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying

                                                         The present sequence is the human transforming growth factor beta-9, designated 2tgf beta-9. Human 2tgf beta-9 was isolated from an arrayed pitultary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating antiviral activity and may also be used to regulate the proliferation, edifferentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.

factor beta-9, designated Ztgf beta-9. Human Ztgf beta-9 was isolated from an arrayed pituitary gland cDNA plasmid library by PCR screening. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       degenerative cartilaginous disorder; transplantation associated disease.

A composition containing antiAgonists to the PR0 polypeptides or individual components or useful for treating a mammal with an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, idiopathic inflammatory myopathy. Sjorn's syndrome, systemic sclerosis, an idiopathic inflammatory myopathy, Sjorn's syndrome, systemic sclerosis, autoimmune haemolytic anaemia, autoinmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyalinating disease, an autoimmune or immune-mediated skin disease, contact dermatitis, an allergic disease e.g. food hypersensitivity, asthma, a transplantation associated disease, or a chronic inflammatory demyelinating polyneuropathy. Treating a pr013 or pr0112 polypeptide agonist, or antigonist to the mammal. Numerous examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
```

```
The present sequence represents an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins. IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-176, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  43 PTNLRSVSPWAYRISYDPARYPRYLPEAYCLCRGCLTGLFGEEDVRFRSAPVYMPTVVLR 102

The present sequence is an epitope-bearing peptide derived from the human transforming growth factors beta-9, designated £tgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyorrophic lateral sclerosis (ALS), Alzhenier's disease, Huntington's disease, parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                            Polynucleotides encoding a novel transforming growth factor beta-9 polypeptide, designated Ztgf beta-9, useful as an antiviral and antiproliferative agent -
                                                                                                                                                                                                                                                                                                                       Claim 6; Page 94-95; 97pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an interleukin (IL)-173 polypeptide. It is a mammalian homologue of the cytckine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-171, IL-172, IL-173, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and Sequence encoding IL-171 is useful for identifying genes, mRNA and IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                                                                                                                                                                                                                New DNA sequence encoding a mammalian homolog of CTLA-8, designated interleukin-171 (IL-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis;

It is a mammalian homologue of the cytokine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-171, IL-175, IL-172, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and CDNA molecules which code for related or homologous proteins. The IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                                                                                                              103

                                                                                                                                                                                                                        The present sequence is an epitope-bearing peptide derived from the human transforming growth factor beta-9, designated Ztgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antivital activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoletic cells and stromal cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an epitope-bearing peptide derived from the human transforming growth factor beta-9, designated Ztgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as myotrophic lateral sclerosis (ALS), Alzhedimer's diseases, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides proliferation, differentiation and apoptosis of neuropathie the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human transforming growth factor beta-9; 2tgf beta-9;

The signal sequence extends from amno acid residues 1 to 22. Murine 2tgf beta-9 was found to be highly expressed in the HCL hypothalamic cell line. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and pertiheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antivirity and may also be used to regulate the proliferation, differentiation and apoptoals of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                   Murine transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease; peripheral neuropathy; demyelinating disease; multiple sclerosis; antiviral; cytostatic.

The present sequence represents an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic

The present sequence reresents an interleukin (IL)-173 polypeptide. It is a mammalian homologue of the cytokine designated CTLA-8 (also referred to as IL-17. The specification also describes homologues IL-171, IL-172, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and cDNA molecules which code for related or homologous proteins. The IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequence encoding a mammalian homolog of CTLA-8, designated interleukin-171 (IL-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal physiology or development -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murine transforming growth factor beta-9; Ztgf beta-9; Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease; peripheral neuropathy; demyeling disease; multiple sclerosis;

The patent discloses novel polynucleotides and their corresponding proteins which play a major role in induction of growth, cell migration and proliferation, cell-cell interaction and the differentiation of tissue-specific cells. These proteins are important in the maintenance of tissue integrity and thus are important in wound healing. They are useful in various assays to determine the biological activity, to raise antibodies, to isolate corresponding interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, and as therapeutic target in a whole range of disease states. Compositions comprising the novel proteins of the invention are useful for treating mammalian disorders. Polynucleotides of the invention are useful in genome and physical mapping, in positional cloning of genes, to tag or identify an organisms), and for the diagnosis and treatment of mammalian diseases which is the consequence of inappropriate expression of kinase genes. They are useful for promoting immune response as part of a vaccine or anti-cancer treatment, as tracter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnostic for specific types of cancer and for development of an anti-cancer treatment, and as a target for antagonists in the treatment of diseases such as asthma and allergy. They are also useful to inhibit or enhance the activity of the soluble molecule that binds proteins of the invention, for tissue and neural regeneration, to promote or block cell trafficking, and as anti-inflammatory and/or vaccine adjuvant. The present sequence is ZCYTOT protein, a secreted protein from mouse which belongs to the family of interleukin-17 (IL-17)-related cytokines.
                                                                   Novel isolated polypeptide useful to isolate corresponding interacting proteins or other compounds, to quantitatively determine levels of interacting proteins or other compounds, and as therapeutic target -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alzheimer's disease; neurodegenerative disease; Huntington's disease; amyotrophic lateral sclerosis; ALS; Parkinson's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     treatment, as immunoregulatory and anti-inflammatory molecule, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peripheral neuropathy; demyelinating disease; multiple sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human transforming growth factor beta-9, 2tgfbeta-9 peptide-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes murine transforming growth factor beta-9, designated 2tgf beta-9. Murine 2tgf beta-9 was found to be highly expressed in the HCL hypothalamic cell line. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. 2tgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                 Polynucleotides encoding a novel transforming growth factor beta-9 polypeptide, designated Ztgf beta-9, useful as an antiviral and antiproliferative agent .

The present sequence is an epitope-bearing peptide derived from the human transforming growth factors beta-9, designated Ztgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzhedimer's diseases, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represent an interleukin-173 (IL-173) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-176, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide encoding a mammalian Interleukin-17 like protein used to identify genes for homologous proteins -

                                                                                                                                                                                                 The present sequence is an epitope-bearing peptide derived from the human transforming growth factor beta-9, designated 2tgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, gilal cells, lymphocytes, hematopoietic cells and stromal cells.

These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzheimer's disease, Huntington's disease, parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides have antiviral activity and may also be used to regulate the proliferation, differentiation and apoptosis of neurons, glial cells,

                                                                                                                                                                                                                                                                                                                     The present sequence is an epitope-bearing peptide derived from the human transforming growth factor beta 9, designated Ztgf beta-9. These peptides are used to raise antibodies, including anti-idiotypic antibodies. This can be used to treat a variety of neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS), Alzahaimer's disease, Huntington's disease, Parkinson's disease and peripheral neuropathies, or demyelinating diseases including multiple sclerosis. Ztgf beta-9 peptides proliferation, differentiation and apoptosis of neurons, glial cells, lymphocytes, hematopoietic cells and stromal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, angiotensin converting enzyme-2; ACE-2; angiotensin I; Ang.(1-9);

                                                                                                                                                                                                                                                                                                                               The present sequence represents a human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (1.9). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, acute active heart failure, acted and renal
                                                                                                                                                                                                                                                              Isolated nucleic acid encoding angiotensin converting enzyme-2 (ACE-2) polypeptide useful for detecting an ACE-2 therapeutic for treating hypertension, congestive heart failure, myocardial infarction, atherosclerosis and renal failure -

The invention relates to the metalloenzyme Zace2. Zace2, an angiotensin-
converting enzyme is a zinc metallopeptidase that plays roles in blood
pressure regulation and fertility. Zace2 can be expressed by standard
recombinant methodology. Zace2 polypeptides are useful for treating an
inflammatory bowel disease (e.g. Crohn's disease and ulcerative collits),
diseases associated with inflammation like arthritis and enterocollits,
as targets for identifying medulators of zinc protease activity, for
creening or identifying new angiotensin-converting enzyme (ACE)
inhibitors, and as a basis for rational drug design for inhibitory
molecules. The nucleic acids can be used to detect the expression of a
zace2 gene in a biological sample, as probes for in vivo diagnosis and
conferentine whether a subject's chromosomes contain a mutation in the
zace2 gene, and to detect aberrations associated with the Zace2 locus.
Inhibitors of ACE are used for treating Mypertension of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               conditions, including left ventricular systolic dysfunction, progressive renal impairment, scleroderma renal crisis, congestive heart failure due to dysfunction, and treatment of atherosclerosis. Zace2 agonists may be used to treat infertility while Zace2 antagonists are used for inducing
                                                                  Angiotensin-converting enzyme, Zace2, useful for treating inflammatory bowel disease, e.g. Crohn's disease and ulcerative colitis, or diseases associated with inflammation such as arthritis and enterocolitis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 used to treat infertility while Zace2 antagonists are useu for inversinfertility. The present sequence represents the human Zace2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RAC protein kinase C-terminal binding protein C-terminal region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                    The present amino acid sequence is human angiotensin converting enzyme-2 (ACE-2), also referred as peptidyl dipeptidase A (EC 3.4.15.1). Nucleic acid sequence encoding ACE-2 is useful as antisense or antigene agents for sequence specific modulation of gene expression or in the analysis of single base-pair mutations in the gene. Nucleic acid sequence encoding ACE-2 is useful in therapeutics, diagnostics and in screening assays. ACE-2 antagonist is used to treat hypertension or congestive heart failure (CHF). ACE agonist is used to reduce the inflammation and pain resulting from an insect sting or bite, which was accompanied by an injection of bradykinin. Anti-ACE-2 antibodies are used to monitor ACE-2 an aberrant protein level.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human nucleic acids encoding secreted proteins, useful in the treatment, prevention or diagnosis of immune disorders (e.g. autoimmune diseases), blood protein disorders and hyperproliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Moore PA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                novel RAC protein kinase C-terminal binding protein (CTBP). Its sequence was deduced from a cDNA clone (AAT67134) isolated from a HeLa library following a yeast two-hybrid screen assay for clones that showed specific interaction with RAC's kinase domain with its C-terminal extension. The C-terminal domain of RAC protein kinase is phosphorylated in response to insulin activation, suggesting a role for CTBP as a modulator of insulin action. RAC protein kinase (see AAW17972) and modulators of insulin-mediated intracellular
RAC protein kinase, or modulator excluding wortmannin and vanadate, for use as medicament - and screening potential modulators of insulin mediated intracellular signalling using RAC-PK, or fragment
                                                                                                                                                                                                                                                                                    signalling such as CTBP can be used in the treatment of abnormalities of cellular metabolism, diseases involving an anomaly in insulin response, and diseases involving an anomaly in glycogen
                                                                                              This polypeptide comprises the putative C-terminal region of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human secreted protein sequence encoded by gene 6 SEQ ID NO:115.

                                  a new method to identify differentially expressed prokaryotic genes using a large number of arbitrarily primed polymerase chain reactions comprises separating two populations of microbial cells, where a first population is contacted with a stimulating agent; where a first population is contacted with a stimulating agent; cartacting total RNA from both populations by preparing amplifying the extracted RNA from both populations by preparing a collection of at least thirty-two different arbitrary primers, where cach primer comprises a common and a variable region; individually contacting each primer of with a sample of extracted RNA from the contacting each primer of with a sample of extracted RNA from the products are produced; purifying the two sets of amplification products; identifying the amplification products generated in the first population which differ from products generated in the second population as differentially expressed genes: and optionally sequencing the identified differentially expressed genes: The advantage over previous methods is that previous methods of differential display to clone genes using thirty-two or thirty primers have isolated four and one genes, respectively. The new method using a greater number of primers has isolated twenty-one induced gene fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Brewer LA, Duan R, Ebner R, Ferrie AM, Florence C;

This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAXY9002) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 53 novel genes and their fragments (nucleic acid sequences: AAXY901-X79064; amino acid sequences AAXY14411-Y14464) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 53 polynucleotides, based on which tissues they are most highly expressed in (see AAX79011 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; colon cancer; colon cancer antigen; diagnosis; detection; identification; cytostatic; cardioactive; neuroprotective; vulnerary; immunomodulatory; muscular; gynaecological; gastrointestinal; nephrotropic; antiinfective; antibacterial; gene therapy; wound; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; renal disorder; infectious disease, cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                            New isolated human genes and the secreted polypeptides they encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                       human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and
                                                                                                                                                                                                                    can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present

The present sequence represents a partial human interleukin-21 (IL-21) protein. The specification also describes IL-22 polynucleotides and polypeptides. The IL-21 polynucleotide was isolated from a cDNA library of apoptotic T-cells. IL-21 and IL-22 may be useful in treating of efficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilization (chemotaxis) of immune cells, treating or detecting deficiencies or thrombolytic activity, in treating or detecting deficiencies or thrombolytic activity, in treating or detecting autoimmune disorders, treating asthma (particularly allergic asthma) or other respiratory problems, to treat and/or prevent organ rejection or graft-versus-host disease (GVHD), to modulate inflammation, to treat or detect infectious agents, to differentiate, proliferate and attract cells, leading to the regeneration of tissues, IL-21 and IL-22 may also increase or decrease the differentiation or proliferation of embryonic stem cells and hematopoietic lineage, may be used to modulate mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence is a bait polypeptide used in a Helicobacter pylori two-hybrid screen to identify protein-protein interactions. The method is used to identify a recombinant cell clone expressing a prey polypeptide which is capable of interacting with the bait polypeptide. The two hybrid system is useful for screening compounds for antibacterial activity. It may be used in the treatment of gastric ulcers. The polynucleotides are useful as amplification primers or specific detection probes. The polypeptides, vectors or host cells can be used as immunogens to produce mono- or polypetional antibodies. The polynucleotides, polypeptides, and used so immunose to produce mono- or polypetides. The modulating agents can be used to produce a pharmaceutical composition.

                                                                                                                                                                            proteins, called prostate cancer antigens, given in ABB56563 to AAB57302. The proteins, called prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotroptc, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome lidentification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The polypeptide is an IL-17-like (CTIA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-176, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents an interleukin (IL)-171 polypeptide. It is a mammallan homologue of the cytokine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-171, IL-175, IL-173, IL-174, IL-176, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and sequence encoding IL-171 is useful for identifying genes, mRNA and sequence encoding IL-171 is useful for identifying genes, mRNA and IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying compounds that selectively bind to IL-171.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New DNA sequence encoding a mammalian homolog of CTLA-B, designated interleukin-171 (IL-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal physiology or development.
                                                                                                                                                                                                                                                                                                        Interleukin, IL-171; cytokine; CTLA-8; IL-17; IL-175; IL-173;

The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for

                                                                                                                                                                                                                           The present sequence represents a secreted or transmembrane polypeptide. The specification describes polypeptides designated PR01484, PR04334, PR01122, PR01899, PR01890, PR01897, PR01785, PR04352, PR04352, PR04354, PR04354, PR04356, PR04356, PR040354, PR04036, PR040397, PR04036, PR04424, PR04422, PR04430 and PR04499. PR01889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their agonists and antagonists are useful treating a condition associated with expression or activity of the polypeptide. Conditions treated include obesity, diabetes or hyper-or hypo-insulinemia. The polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful for treating kidney disorders associated with decreased mesangial cell function such as Bergers disease or other

                                                                                                          Key
```

```
The present sequence represents an interleukin-171 (IL-171) polypeptide. The polypeptide is an IL-17-like (CTLA-8 related) protein. It is a member of a new group of interleukins, IL-170 polypeptides. The members comprise IL-172, IL-173, IL-174, IL-177, and IL-171. IL-170 protein can be used to treat abnormal proliferation e.g. cancer or degenerative conditions. Antibodies can be used in diagnostic methods to detect over production of IL-170 protein in cells or body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide encoding a mammalian Interleukin-17 like protein used to identify genes for homologous proteins -

It is a mammalian homologue of the cytckine designated CTLA-8 (also referred to as IL-17). The specification also describes homologues IL-17, IL-175, IL-173, IL-173, IL-174, and IL-177. The DNA sequence encoding IL-171 is useful for identifying genes, mRNA and cDNA molecules which code for related or homologues preteins. The IL-171 protein, antibodies against IL-171, and compounds which have binding affinity to IL-171 are useful in treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions, or degenerative conditions. The IL-171 protein can be used in kits and assay methods for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA sequence encoding a mammalian homolog of CTLA-8, designated interleukin-171 (II-171), useful for recombinant production of IL-171 which can be used for treating conditions associated with abnormal physiology or development.

                                                                                                                        neutrophils, granulocytes, or platelets, this may be useful during chemcherapy. IL-17 homologues have at least one activity selected from induction of cytotoxic T cells, induction of lymphokine-activated killer cell proliferation or a B or T cell stimulation. The IL-17 homologue may also be used to treat viral or bacterial infections,
                                                                                                                                                                                                                                                                                                                                 immune related diseases, anemia, leukemia, thrombocytopenia, uremia, Von Willebrand disease, postoperative cardiovascular dysfunction, treatment of AIDS (acquired immune deficiency syndrome)-related bone marrow failure, and inflammatory diseases of the gastrointestinal system, joints, and lungs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This sequence has identity with the cytokine IL-17 and cytother T-lymphocyte-associated antigen B (CTLA-B) and has leucine zipper pattern. PRO1122 is expressed in pancreas, small intestine, stomach and testis also. It shares about 26-28% amino acid identity with IL-17 and IL-17B. The entire coding region of IL-17C can be used as hybridisation probe. The PRO1122 polypeptide, agonist or antagonist, is used to diagnose and treat a degenerative cartilaginous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a human interleukin-21 (IL-21) protein. The specification also describes IL-22 polynucleotides and polypeptides. The IL-21 polynucleotide was isolated from a cDNA library of apoptotic T-cells. IL-21 and IL-22 may be useful in treating deficiencies or disorders of the immune system, by activating or

The sequence is PRO1122 which is the human Interleukin 17C ligand,
IL-17C, encoded by DNA 62377-1381-1. A composition
Containing antiAgonists to the PRO polypeptides or individual components
containing antiAgonists to the PRO polypeptides or individual components
containing antiAgonists to the PRO polypeptides or individual components
containing antiAgonists a spondyloarthritis, osteoarthritis,
juvenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an
idiopathic inflammatory myopathy, Sjognen's syndrome, systemic
chromocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal
disease, a demyelinating disease, an autoimmune or immune-mediated skin
disease, contact dermatitis, an allergic disease e.g. food
hypersensitivity, asthma, a transplantation associated disease, or a
chronic inflammatory demyelinating polyneuropathy. Treating a
chronic contider adjatious disorder comprises administering a PRO1031 or
PRO1122 polypeptide agonist, or antagonist to the mammal. Numerous
examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present sequence is the human PRO1122 polypeptide, with a C-terminal Gly(His)8 tag, IL-17C.his, derived from the clone DNA62377-1381-1. This sequence is used in a competitive binding experiment for the immunoprecipitation of IL-17 receptor extracellular domain (IL-17R ECD). The entire coding region of IL-17C can be used as hybridisation probe. The PRO1122 polypeptide, agonist or antagonist, is used to diagnose and treat a degenerative cartilaginous disorder.

A.Title: The minimal gene complement of Mycoplasma genitalium.
A.Reference number: A64209, MUID:96026346
A.Accession: B64218
A.Accession: B64218
A.Status: preliminary; nucleic acid sequence not shown; translation not shown
A.Molecule Type: DNA

N.Alternate.names: hypothetical protein GT9_orf61
C.Species: Mycoplasma pneumoniae
A.Variety: ATCC 29342
C.Decies: Mycoplasma pneumoniae
A.Variety: ATCC 29342
C.Date: 23-Aug-1996 #sequence_revision 13-Mar-1997 #text_change 07-Dec-1999
C.Accession: $62805; $73979
C.Accession: $62805; $73979
C.Accession: $62805; $73979
A.Title: Sequence analysis of 56 kb from the genome of the bacterium Mycoplasma pneumonial A.Reference number: $62797; MUID:96177562
